

Twoody — Fact sheet

Twoody is a free AI assistant that runs on its user's own computer, Mac, Windows or Linux. It answers their questions and reads their documents with a model installed on the computer: conversations are processed by that model, not by an online AI service, and it keeps answering offline once the model is installed. Its answers cite their sources, it remembers what matters from one conversation to the next, and its interface is in ten languages. On the computer, it needs no account. Twoody is designed and built in France by Jimmy Douieb, and published by his company, Osmove.

PUBLISHED BY	Osmove SASU (France)
FOUNDED	August 2021
FOUNDER	Jimmy Douieb
REGISTERED OFFICE	Antony, France
CURRENT VERSION	Twoody 0.13.104 (October 16, 2026)
AVAILABILITY	Private beta, with a waitlist. Opening to everyone: date to be confirmed.
PLATFORMS	The same app on Mac (macOS 13.3 or later, Apple silicon and Intel), Windows 10 and 11 (64-bit) and Linux (x86_64). iPhone and Android: companion apps that use the computer's model, in the private beta on invitation; not on the App Store or Google Play yet.
PRICE	Free, with no subscription and no advertising
MODELS	Built-in engine: llama.cpp; on a Mac with Apple silicon, MLX as an option (macOS 14 or later). Suggested by memory: Qwen3.5 4B or 9B, and Qwen3.6 35B-A3B from 24 GB. A catalogue of 57 open-weight models (Qwen, GLM, DeepSeek, Gemma, Mistral, Llama, Phi, gpt-oss, Nemotron...), each with the memory it needs, installed in one click.
OFFLINE	Answers offline once the model is installed. Downloading a model, updates, web search, online connectors and the account need a connection.
DATA	Conversations, memories and the document index are kept on the computer, in a database encrypted since version 0.13.99 with a key kept by the system's keychain (on Linux, when a keyring is available).
OPTIONAL ACCOUNT	Free, to link one's devices. Since version 0.13.20, the conversations kept on it are end-to-end encrypted: Osmove holds no key that can read them. Away from home, the iPhone reaches the computer through the account's relay, which does not have the keys to read what they exchange.
LANGUAGES	Ten, in the apps and on the site: English, French, German, Spanish, Italian, Portuguese (Brazil), Dutch, Japanese, Chinese (simplified) and Korean. Twoody answers in the language you write to it in.
LICENCE	Business Source License 1.1 (not an open-source licence); code not published yet
